

- Notes:
- Values for resistors and capacitors have largely been chosen based on datasheet recommendations.
- Except for C_GVDD, C_BSTx and R_GHx/GLx on the gate driver/mosfet gates.
- Voltage divider resistances have been chosen to ensure no damage is done to the MCU ADC pins and also allow for relatively accurate readings.
- Other values not mentioned in any datasheets, e.g. 1nF decoupling on the ADC lines has been chosen out of respect for the nature of their purpose.
- Generally parts chosen for simplicity, good documentation and overall fitting the needs.
